Light Weight Tactical Harness

FRONT

REAR

This harness is a front only tie-in version of our Pro-Rescue Harness that has been tested to NFPA Standards for many years. We have eliminated the Pro-Rescue's rear tie-in point and used lighter weight black powder coated buckles. These buckles are a two piece design with black wrinkle power coating making them non reflective. The two piece design allows them to be passed through one another so the leg strap can be undone from the buckle without changing the adjustment. Thus the leg strap buckle can be tucked into the waist of the harness allowing the wearer to walk easily and then re-install the buckle to the other half and quickly be ready to use the harness.

There is one gear loop that can be slid around the waist to be positioned anywhere that is comfortable. Others can be added upon request. Weight; 1 lb, 10 oz.

INSTALLATION

Hold the front of the seat harness and step into the leg straps like you would a pair of pants.

Pull waist belt up around waist and tighten the waist belt buckle.

Adjust the leg straps so they are comfortable to walk in. You should be able to place your hand flat against your leg and slide your fingers under the leg strap comfortably. This will insure that the leg straps are not too tight.

By sliding the small half of the leg buckle through the larger half, the leg strap buckle half can be tucked into the waist for long walks without taking off the harness.
